TSANG Cheuk Nam

Hong Kong | cheuknam2004@gmail.com | rairurairu.github.io | github.com/rairurairu

Summary

Final-year HKUST Industrial Engineering & Engineering Management student (Extended Major in AI). Won the "Reinventing Insurance for an AI-native World" track (200+ participants) with an original insurance methodology, then built the complete system. Designs AI systems and the processes around them, directing AI coding agents (Claude Code, Codex) that write about 95% of the code. Internship now; full-time from January 2027.

Education

The Hong Kong University of Science and Technology (HKUST) Hong Kong
BEng in Industrial Engineering & Engineering Management; Extended Major in AI *Sep 2022 – Dec 2026 (expected)*

Honors: Winner, "Reinventing Insurance for an AI-native World" track (sponsored by bolttech), Hong Kong AI Summit: BUILD ACROSS Hackathon, 200+ participants (Oct 2026)

Coursework: Statistical Machine Learning; Generative AI and LLMs for Operations Research; Stochastic Models

Projects

Budget-Based Microinsurance | *Hackathon-winning methodology* · Rust, TypeScript, Python Oct 2026

- Designed an original AI-native insurance methodology: customers pick a monthly price and AI builds a personal cover, answering long-standing pain points for insurers, partners and customers.
- Turned insurance into a monthly service that prevents losses as well as paying for them: partners fund rewards for personal prevention tasks from spare capacity, and event covers pay automatically.
- Built the payout engine to settle automatic payouts for 1 million policies in 1.6 seconds, against a 5-second target.

LLM Brand Recommendation Benchmark | *AI-native market research* · Python, SQLite, LLM APIs Sep 2026

- Designed an AI-run benchmark of which brands AI assistants recommend, setting every test category at the level customers shop for, so results compare cleanly and new categories fit in without rework.
- Measured that an AI assistant's top-ten brand recommendations matched verified brands 92.5% of the time across 51 product categories.

Using LLMs for Optimization | *Final Year Project, Experiment & Benchmarking Lead* Completed 2026

- Led the experiments behind a reliable way for LLMs to solve business routing problems: the LLM plans and a standard optimizer does the exact work, matching an LLM that writes the whole program at a fraction of the cost.
- Showed the planner approach found a valid routing solution in every trial, on average within 1% of a dedicated solver's best, and matched the solver on public benchmark tests.

Self-Hosted Personal AI Agent | *Always-on AI agent and coding-agent team* · Python, Kotlin Aug 2026 – Present

- Runs an always-on AI agent and a team of coding agents on a home server, directed from a phone, so research and builds keep going around the clock; rules drawn from real failures keep them building only what was asked.

Polymarket Market-Making & Forecasting Models | *AI-agent-driven quantitative research* Aug 2026 – Present

- Built football forecasting models that beat the standard Elo rating on matches they had never seen.
- Measured market-making risk by replaying past orders, and retired a forecasting signal once simulated trading showed no real advantage.

9UPPER Online | *Multilingual real-time web game* · Next.js, TypeScript, Supabase Mar 2026 – Present

- Built it with AI coding agents and grew it through SEO, GEO and AEO to over 500 visitors a day and about 600 Google clicks a month, ranking in Google's top five on average; ChatGPT and Claude search recommend it.

Skills

AI application design: LLM components, evals and guardrails, structured outputs, model routing, human-in-the-loop

AI-native transformation: process redesign, deciding what AI, rules or people handle, cost and quality measurement

Agentic development: Claude Code, Codex, multi-agent orchestration, harness and context engineering

Software: Python, TypeScript, React, Rust, PostgreSQL, REST APIs, Docker, Linux, Git

Languages: Cantonese (native), English (fluent), Mandarin (fluent)
